VIT BHOPAL

Digital Literacy Awareness Project (CSE0001)

PROJECT REPORT

Name- Vatsal Kirti Srivastava

Registration no. – 25BSA10076

Branch- CSE (Cloud Computing)

Year- 1st Year

Introduction:

The Digital Literacy Awareness Project (CSE0001) is more than a technical requirement, it serves as a practical roadmap for navigating the complexities of our professional and academic lives. In an era where being "online" is a constant state of being, simply knowing how to operate a device is no longer enough. This project was designed to bridge the gap between basic usage and intentional, ethical, and safe digital engagement.

Acting as a Student Digital Ambassador, I completed five hands-on tasks that mirrored real-world challenges. Throughout this journey, I explored the art of visual communication,curated a professional digital footprint, and refined my technical skill set. I also delved into the nuances of professional email etiquette and analysed the sobering reality of modern cyber threats. Ultimately, this process was about more than just completing assignments; it was about building a secure, impactful online presence and learning to wield digital tools with a sense of responsibility and purpose.

Task 1 Report:

Report I used Microsoft PowerPoint for make this design because I don’t know much other tools and this one is little easy for me to use. I already use it before so I feel okay with it. Starting was easy but making it look good was not that easy actually. In this design I try to explain digital literacy in simple way so people can understand it easy. I divide it into parts like “What is Digital Literacy”, “Essential Tools”, “Safe Practices and

Professional Presence”. In this part I show things like how we use internet, what tools we use, how to stay safe and how to behave online. I also add some icons and light colours so it does not look too boring. One thing I find difficult was arranging everything properly. First it was looking very messy and nothing was in right place. I change it many times but still not looking good in starting. It was little confusing also. But after some time it becomes better and I understand that small - small changes make big difference. Now I feel design is not only about writing, it also about how we show it properly.

Task 2 Report:

For this task, I made my profiles on GitHub, LinkedIn and Kaggle. At first I was just doing it because it was given, but while doing it I kind of understood why it matters. Like nowadays if someone searches your name and nothing comes up, it doesn’t look that good. So it felt useful in a way.

On GitHub, I created the profile README and added my name, branch, year and a small line about what I want to learn. I didn’t write too

much, just kept it simple. LinkedIn was a bit different, I added my education details there. I'm still not very used to LinkedIn honestly, it feels a bit formal, but I think it can help later. Kaggle is something I just started, it looks interesting but also a bit confusing right now.

In the next few years, I'll try to use GitHub more and upload my projects, even small ones. On LinkedIn, maybe I'll slowly start connecting with people. For Kaggle, I just want to learn step by step and try some competitions. Overall, I think this will help me build something for my future, even if it's small right now.

Task 3 Report:

Reports I used hacker rank for doing this task. I created my account there and solved one beginner question called "Solve Me First". It was simple question but still helpful for understanding how the platform actually works. I learn how to take input and give output properly. At starting I was little confused where to write code and how to submit, but after trying 2–3 times I understand it. I also check some other questions just to see

how level is increasing, some was easy and some was little difficult. I also make a Google Form for Digital Literacy Awareness Quiz. I add 5 questions in it, including MCQ and one short answer. It was easy to create but I was little confused in settings part. I also see the response sheet and it was interesting that all answers come automatically there. These tools will help me in study because hacker rank make coding better and improve thinking. And Google Form is useful for collecting data in projects. I feel this type of learning is more useful than only reading theory.

Task 4 Report:

One situation where poor digital communication can cause problem is when someone share wrong information without checking it first. For example, if a student send message in college group that exam date is changed, but actually it is not true, then many students can believe it easily. They might stop studying or get confused later, and then at last time they feel stress. These types of thing happen very easily because people trust

messages from their own group without thinking much.

This problem can be avoided if the person just checks the information before sharing it. It is always better to confirm from official source like college website or teacher instead of just forwarding. Also people should think little before sending anything online. One small mistake can create big problem for many people, so we should be more careful while using digital communication.

Task 5 Report:

While researching about cybercrime, one thing that really surprised me was how normal these scams actually look. It’s not like some big hacking or anything, just simple messages that create panic. Like if you get message saying your account will be blocked, you won’t think much and just click it. That’s how they trap people. Even I feel I could fall for it if I am not careful. Also I didn’t realize UPI scams are happening so much in India, especially those fake screenshot and collect request ones. One thing I will change now is not reacting quickly to such messages. Earlier I don’t

use to think much if something looked real. Now I will stop, check and then act. Also I will be more careful while sending money, because once it is gone there is no easy way to get it back.
